Disease-Associated Voice Research Signals

Domain	Research Signal	Level	Confidence	Observed Voice Biomarkers
Neurological	Parkinsonian Voice Pattern	Low	82%	Mild tremor-linked rhythm variation detected with stable vocal coordination.
Neurological	Cognitive Decline / Alzheimer's Pattern	Moderate	78%	Pause frequency and speech-flow irregularity slightly elevated.
Mental Health	Anxiety-Associated Voice Pattern	Elevated	88%	Higher vocal tension, compressed pitch range, and rapid rhythm shifts observed.
Mental Health	Depression-Associated Prosody Pattern	Moderate	80%	Reduced pitch variability and lower vocal energy profile detected.
Respiratory	COPD / Respiratory Strain Pattern	Low	84%	Breath stability remains mostly consistent with mild airflow fatigue.
Cardiovascular	Cardiovascular Stress Signal	Moderate	76%	Moderate vocal fatigue and energy fluctuation markers detected.

Metabolic	Type 2 Diabetes / Neuropathy Pattern	Moderate	79%	Subtle resonance instability and vocal muscle-energy reduction observed.
Endocrine	Thyroid / Hormonal Stability Pattern	Low	74%	No major long-term vocal fatigue indicators identified.
ENT / Voice	Vocal Pathology / Hoarseness Pattern	Low	86%	Stable harmonic profile with minimal strain signatures.

Important Disclaimer

Nuros provides AI-generated voice biomarker research signals only. This report is not a diagnosis and does not confirm the presence of disease. Results should be discussed with a licensed healthcare professional if symptoms persist or worsen.
